| Construction/Renovation/Land/ Planning Engineering | | 0 |
| Total State Funds Requested (m | ust equal total from question #6) | 500,000 |

12. Program Performance

a. What specific purpose or goal will be achieved by the funds requested?

The Chapel Hill Neighborhood Drainage Improvements Project will provide protection of life, health, safety and property. Severe flooding in the neighborhood is a public safety hazard because emergency medical response, fire and law enforcement services can have difficulties reaching the residents during emergency calls. Standing water poses a health threat from diseases, including those caused by breeding mosquito populations, sanitary sewer or chemical contaminants, and electrocution. Additionally, it causes hardship and disruption to community access and egress. When the roads and low-lying properties are flooded, residents are unable to maintain a reasonable quality of life as mobility issues arise.

The drainage improvements will be implemented to mitigate the extent of flooding after storm events. The stormwater system will collect, convey, and treat the water in each catch basin before being discharge by pumping or gravity to a canal or percolating into the ground.

b. What activities and services will be provided to meet the intended purpose of these funds?

The project will provide an upgraded stormwater drainage system within the neighborhood to allow stormwater runoff to drain from the roadway to swales, exfiltration trenches, a new stormwater pumping station, and positive outfalls to the E-4 Canal.

The major items to be included in the engineering design project are new roadway drainage inlets, piping, swales, and exfiltration trenches; reconstruction and regrading of the roadway; and up to two positive outfalls to discharge stormwater to the E-4 Canal. Each outfall will include stormwater treatment.

c. What direct services will be provided to citizens by the appropriation project?

LFIR # 1417

By increasing the number of storm drainage inlets and storm pipe capacity, the project greatly mitigates roadway flooding from severe rainfall storms events. The proposed drainage improvements will eliminate impassable roads, the potential for property damage and public safety hazard, for example, driving through flooded streets can produce a wake that worsens flooding to buildings along the street, additionally, electrical currents can travel through water and cause electrocution. These threatening conditions occur during, and for a period after, a heavy rainfall. This project mitigate these routine flooding issues.

In addition to the expected increase of resident's satisfaction and wellbeing, the community will no longer be exposed to flooding repercussions, i.e.

- 1. Unable to access/egress dwellings due to water depth, extent of inundated area and water ponding duration
- 2. Soil erosion, damage to vegetation and property
- 3. Safety concerns
- 4. Hindering school/work attendance

d. Who is the target population served by this project? How many individuals are expected to be served?

The target population served by this project is approximately 1,800 residents in a residential middle class neighborhood. In addition, flooding in the Chapel Hill neighborhood adversely impacts the neighboring properties to the east, including Bethesda Hospital East and the adjacent neighborhood. In general, the City of Boynton Beach's population is 30% Black or African American, 15% Hispanic or Latino, 2% Asian, and 2% Multiracial.

Lengthy periods of neighborhood flooding inhibit the ingress and egress to the residents' properties and access to public transportation. The extended periods of standing water pose a health threat from diseases, including those from breeding mosquito populations, sanitary sewer or chemical contaminants, and possible electrocution from fallen electrical lines after major storm events.

e. What is the expected benefit or outcome of this project? What is the methodology by which this outcome will be measured?

City will implement drainage improvements in the Chapel Hill neighborhood to improve the level of stormwater service to the residents and reduce the impacts of flooding after rainfall events and major storm events. The improvements will be designed by an engineering consulting firm utilizing the City's general engineering consulting contract, which was implemented through a public solicitation process. The City will measure progress through monthly progress meeting and periodic review of engineering documents, drawings, and specifications.

f. What are the suggested penalties that the contracting agency may consider in addition to its standard penalties for failing to meet deliverables or performance measures provided for the contract?

The improvements will be designed by an engineering consulting firm utilizing the City's general engineering consulting contract, which was implemented through a public solicitation process. The consultant will be administered by City staff, the City will strictly enforce the requirements of the contract. The City will measure progress through monthly progress meetings and periodic review of engineering documents, drawings, and specifications.

13. The owners of the facility to receive, directly or indirectly, any fixed capital outlay funding. Include the relationship between the owners of the facility and the entity.

The Chapel Hill neighborhood is located within the city limits of the City of Boynton Beach, and the roadways within the neighborhood are owned by the City. The City also owns the Forest Hill Park property that could be potentially used for a one acre stormwater retention pond and a pumping station.
