

HOUSE OF REPRESENTATIVES STAFF ANALYSIS

BILL #: HB 889 W/CS Certified Stroke Treatment Centers
SPONSOR(S): Bilirakis
TIED BILLS: None. **IDEN./SIM. BILLS:** SB 1660 (S)

REFERENCE	ACTION	ANALYST	STAFF DIRECTOR
1) Health Care	23 Y, 0 N w/CS	Rawlins	Collins
2) Health Appropriations (Sub)	11 Y, 0 N	Massengale	Massengale
3) Appropriations		Massengale	Baker
4)			
5)			

SUMMARY ANALYSIS

House Bill 889 establishes legislative intent specifying that the rapid identification, diagnosis, and treatment of ischemic stroke can save the lives of stroke victims, and in many cases can reverse paralysis, leaving victims with few or no neurological deficit and that a strong system for stroke survival is needed in the state's communities to treat stroke victims in a timely manner and to improve the overall treatment of stroke victims. The state intends to construct an emergency treatment system in this state so that stroke victims may be quickly identified and transported to and treated in appropriate stroke treatment facilities.

Specifically, the bill does the following:

- Requires the Agency for Health Care Administration to make available on its Internet website and to the Department of Health a list of the names and locations of hospitals that meet the criteria for a primary stroke center and the names and locations of hospitals that meet the criteria for a comprehensive stroke center.
- Requires that if a hospital no longer plans to meet the criteria for a primary or comprehensive stroke center, the hospital must notify the agency and is required to notify all local emergency medical services providers when services resume.
- Specifies that by February 15, 2005, the agency will notify all hospitals in the state that the agency is compiling a list of primary stroke centers and comprehensive stroke centers in the state.
- Requires the agency to develop criteria for a primary stroke center that are substantially similar to the primary stroke center certification standards of the Joint Commission on Accreditation of Healthcare Organizations.
- Specifies that nothing in these provisions shall be construed as a medical practice guideline or to restrict the authority of a hospital to provide service for which it has received a license.
- Restricts a person from advertising to the public that a hospital is a state-listed stroke center unless the hospital has provided notice to the agency.
- Requires that by June 1 of every year, the Department of Health shall send the list of primary stroke centers and comprehensive stroke centers to the medical director of all licensed emergency medical services providers in the state.
- Requires the department to develop a sample stroke triage or stroke alert assessment tool, post a sample assessment tool on its Internet website, and provide a copy to all licensed emergency medical services providers no later than June 1, 2005.

This document does not reflect the intent or official position of the bill sponsor or House of Representatives.

STORAGE NAME: h0889d.ap.doc
DATE: April 13, 2004

- Requires the medical director of each licensed emergency medical services provider to develop and implement assessment, treatment, and transport destination protocols for stroke patients with the intent to assess, treat, and transport stroke patients to the most appropriate hospitals.
- Prohibits advertisements claiming that a facility is a stroke treatment center unless the facility is certified as provided by law.
- Requires that all emergency medical services providers must comply with all parts of this section by July 1, 2005.

The bill provides for an effective date of July 1, 2004.

FULL ANALYSIS

I. SUBSTANTIVE ANALYSIS

A. DOES THE BILL:

- | | | | |
|--------------------------------------|---|--|---|
| 1. Reduce government? | Yes <input type="checkbox"/> | No <input checked="" type="checkbox"/> | N/A <input type="checkbox"/> |
| 2. Lower taxes? | Yes <input type="checkbox"/> | No <input type="checkbox"/> | N/A <input checked="" type="checkbox"/> |
| 3. Expand individual freedom? | Yes <input type="checkbox"/> | No <input checked="" type="checkbox"/> | N/A <input type="checkbox"/> |
| 4. Increase personal responsibility? | Yes <input type="checkbox"/> | No <input type="checkbox"/> | N/A <input checked="" type="checkbox"/> |
| 5. Empower families? | Yes <input checked="" type="checkbox"/> | No <input type="checkbox"/> | N/A <input type="checkbox"/> |

For any principle that received a “no” above, please explain:

1. The bill creates additional governmental regulation in the form of creating a certification process for stroke treatment centers.
3. The bill limits hospital’s individual freedom from advertising as a stroke treatment center without the “proper” designation as a certified stroke treatment center from the state.

B. EFFECT OF PROPOSED CHANGES:

STROKES

There are two types of strokes: **ischemic** and **hemorrhagic**.

There are two kinds of ischemic stroke: thrombotic stroke and embolic stroke. Together, the two types of ischemic stroke account for about 80 percent of all strokes.

Thrombotic stroke, the most common type, happens when a blood clot (called a thrombus) blocks the blood flow to parts of the brain. A thrombus may form in an artery affected by atherosclerosis. Atherosclerosis is a condition in which the artery lining becomes thickened and narrowed by plaque. Plaque is made of fat, cholesterol, fibrin (a clotting material), and calcium. As plaque builds up in the arteries, blood flows slower and less smoothly, which can lead to clotting. A vessel narrowed by atherosclerosis is more likely to be blocked by a clot, stopping the blood flow. Thrombotic strokes usually happen at night or in the early morning. A transient ischemic attack (TIA), or “mini stroke,” usually happens before a thrombotic stroke.

Embolic stroke is caused by a clot that travels from somewhere else in the body, usually the heart. The clot then blocks an artery leading to or in the brain. An embolic stroke happens when a piece of clot called an embolus breaks loose and is carried by the bloodstream to the brain, where the larger arteries branch off into smaller vessels. The blood clot reaches a point where it can go no farther. It becomes wedged, plugging a small cerebral artery and cutting off the blood supply to the brain.

Most emboli are caused by atrial fibrillation, and according to the American Heart Association, about 2 to 3 million Americans have this condition. Atrial fibrillation is an abnormal, rapid heartbeat where the

two small upper chambers of the heart (called the atria) quiver instead of beating. Quivers cause the blood to pool, forming clots that can travel to the brain and cause a stroke.

There are two kinds of hemorrhagic stroke (caused by bleeding): cerebral hemorrhage and subarachnoid hemorrhage.

Cerebral or intracerebral hemorrhage is caused by a cerebral aneurysm, which is the ballooning out of a weak spot in a blood vessel of the brain. When the aneurysm bursts, there is bleeding into the brain. The amount of bleeding and the location in the brain determine how severe the cerebral hemorrhage is.

In many cases, people with cerebral hemorrhages die from increased pressure on their brains. Still people who survive a cerebral hemorrhage tend to recover more fully and have fewer disabilities than those who have had strokes caused by a blockage (ischemic strokes). Ischemic strokes are more devastating because part of the brain dies when a blood vessel is blocked. The brain cannot make new cells to replace the cells that have died. When a blood vessel in the brain bursts, however, pressure from the blood pushes against part of the brain. If the person survives, the pressure slowly goes away, and the brain may get back some of its former function.

A subarachnoid hemorrhage happens when a blood vessel on the surface of the brain bursts. The burst vessel bleeds into the space between the brain and skull, called the subarachnoid space. With this kind of hemorrhage, the blood does not get into the brain.

With both kinds of hemorrhagic stroke, the burst blood vessel may have been weakened by a head injury or by a condition present since birth. Hemorrhagic strokes also result from uncontrolled high blood pressure.

PREVALENCE

According to the American Stroke Association, every 45 seconds, someone in America has a stroke. Every 3 minutes, someone dies of one. Strokes killed an estimated 163,538 people in 2001 and is the nation's third leading cause of death, ranking behind diseases of the heart and all forms of cancer. Stroke is a leading cause of serious, long-term disability in the United States. In Florida, during 1999, hospital discharged data shows that:

Total Number of Stroke Patients Discharged	73,540
Total Number of Males.	35,154
Total Number of Females.	38,378
Number 44 and younger	3%
Number 45-54	6%
Number 55-64	13%
Number 65-74	27%
Number 75 and older	51%
Total charges	\$1,229,171,753
Total hospital days	363,683
Avg. length of stay.	5 days
Avg. charge per day	\$4,200

In 2004, the estimated direct and indirect cost of stroke in the U.S. is \$53.6 billion. Each year, about 700,000 people experience a new or recurrent stroke. About 500,000 are first attacks, and 200,000 are recurrent attacks. From 1991 to 2001, the death rate from stroke declined 3.4 percent, but the actual number of stroke deaths rose 7.7 percent. Each year, about 40,000 more women than men have a stroke. Because women live longer than men, more women than men die of stroke each year. Women accounted for 61.4 percent of U.S. stroke deaths in 2001. The 2001 death rates per 100,000 population for stroke were 56.5 for white males and 85.4 for black males; and 54.5 for white females and 73.7 for black females. About 4.8 million stroke survivors are alive today.

In 1999, more than 1.1 million American adults reported difficulty with functional limitations, activities of daily living, etc., resulting from stroke. From the early 1970s to early 1990s, the estimated number of noninstitutionalized stroke survivors increased from 1.5 to 2.4 million. In the National Heart, Lung, and Blood Institute's Framingham Heart Study, among ischemic stroke survivors who were at least 65 years old, these disabilities were observed at six months post-stroke:

- ✓ 50 percent had some one-sided paralysis.
- ✓ 30 percent were unable to walk without some assistance.
- ✓ 26 percent were dependent in activities of daily living (grooming, eating, bathing, etc).
- ✓ 19 percent had aphasia (trouble speaking or understanding the speech of others).
- ✓ 35 percent had depressive symptoms.
- ✓ 26 percent were institutionalized in a nursing home.

Treatment

Often, even when stroke patients arrive at the hospital immediately after the first sign of stroke and when individual physicians are willing and able to evaluate them quickly to administer treatment, the pre-hospital and emergency department infrastructure may be unprepared. Hence, there is a growing need for more stroke centers with specialized stroke teams. Ideally, prior to the patient's arrival at a stroke center, trained EMS staff will conduct a preliminary patient evaluation and alert the stroke team in the emergency department at a nearby hospital or clinic. Once in the emergency room, a patient will be carefully evaluated for treatment eligibility using a computer tomography imaging (CT) scan to determine if the patient is experiencing any bleeding in the brain or has suffered recent head trauma. As these "eligibility" criteria are determined, the stroke team will begin an initial patient work-up, including vital signs, blood type and temperature, before beginning treatment. The patient may undergo a CT scan to monitor for intracranial hemorrhage (ICH) and will remain in the intensive care unit, where his or her progress will be closely monitored for at least 24 hours.

While the above is a description of optimal stroke evaluation, treatment and follow-up, unfortunately, it is not indicative of the level of care that many stroke patients currently can anticipate at their local hospital. In a national effort to increase the number of stroke centers and expert teams, several leading medical professional organizations, including the National Stroke Association (NSA), the American Stroke Association (ASA) and National Institute for Neurological Disorders and Stroke (NINDS) established the Brain Attack Coalition. Since the creation of the Coalition in 2000, the collective goal has been to develop specialized stroke teams throughout the country for the sole purpose of rapid patient evaluation. The program works by identifying individual physicians to lead, develop and mobilize teams to implement treatment and enforce NINDS guidelines for stroke patients in acute care hospitals.

The nation's leaders in improving health care for Americans, the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) is collaborating with the Brain Attack Coalition to recognize hospital stroke care programs that meet national quality standards.

Based on the recommendations for primary stroke centers published by the Brain Attack Coalition and the American Stroke Association's (ASA) statements/guidelines for stroke care, the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) has developed an advanced Disease-Specific Care Certification Program. It will provide the first nationwide certification program to evaluate stroke care provided by hospitals.

Conducted under the umbrella of JCAHO's Disease Specific Care Certification Program, the review of applicant organizations will assess:

- ✓ compliance with consensus-based national standards;
- ✓ effective use of primary stroke center recommendations and clinical practice guidelines to manage and optimize care; and
- ✓ performance measurement and improvement activities.

The on-site review process for Primary Stroke Center Certification will involve, in most cases, a one-day evaluation of stroke disease management services. Reviewers—experts such as neurologists, neuroscience nurses, emergency room nurses and doctors or stroke center administrators—will evaluate compliance with national standards and emphasize the management of stroke patients through clinical guidelines and performance measurement assessment.

The evaluation will assess qualifications and competence of practitioners; ongoing efforts to measure and improve process and outcomes; processes established to encourage patient self-management; demonstrated leadership support for the program; and use of clinical information systems to monitor patient care management.

An expert panel, selected jointly by ASA and JCAHO, will make recommendations for a standardized performance measure set for stroke. The measure set will be available by early next year to augment the new certification program. In the interim, reviews of early-adopter hospitals that seek Primary Stroke Center Certification will require submission of four clinical process or outcome measures related to Primary Stroke Center care as listed in the Primary Stroke Center Certification addendum to the Disease-Specific Care Manual under Stroke Measurement areas.

Primary Stroke Centers that successfully demonstrate compliance with program requirements will be awarded certification for a one-year period. A one-year extension will be granted contingent on the submission of an acceptable Periodic Performance Review and the results of the organization's performance measurement and management activities.

The Joint Commission on Accreditation of Healthcare Organizations, which accredits hospitals nationwide, started to offer certification for stroke care in December 2003. Hospitals, which are certified, will also be part of a national study to evaluate best practices for stroke care.

The Joint Commission expects to review about 80 applications in the first half of 2004 from hospitals nationwide to be certified as stroke centers. The creation of these stroke centers has helped decrease the time to treatment for many patients in communities where stroke centers have been established. Rapid evaluation combined with expert coordination of disciplines has led to a decrease in death and disability for thousands of patients who may have suffered a different fate without receiving therapy.¹

Florida Law

Currently, there is no statutory process for a hospital to be a certified as a stroke treatment center. According to the Department of Health, there are hospitals that are self-proclaimed stroke centers, but there is no evidence that these facilities are capable of providing better care for stroke victims than any other acute care hospital.

The Hospital and Outpatient Services Unit (HOSU) within the Division of Health Quality Assurance of the Agency for Health Care Administration is responsible for licensing, registering, and regulating hospitals, outpatient and health care service facilities. The HOSU strives to ensure that these facilities and services comply with standards of safety and quality established by state and federal regulation.

All facilities that offer services more intensive than those required for room, board, personal services and general nursing care, must be licensed to operate in the state. Hospitals are defined as facilities with a range of services that are offered with beds for use beyond 24 hours by individuals requiring medical, surgical, psychiatric, testing, diagnosis, and treatment for illness, injury, deformity, infirmity, abnormality, disease, or pregnancy. Hospitals also have available clinical laboratory services, diagnostic X-ray services, and treatment facilities for surgery or obstetrical care, or other definitive medical treatment of similar extent.

Unaccredited facilities and initial licenses require certification and licensing surveys required by law. Under state and federal regulations, accredited hospitals are "deemed" to meet the requirements and do not receive an annual license and certification survey. All hospitals are subject to annual life-safety and biennial risk management surveys. To be licensed, facilities must meet state licensing requirements, submit a completed application, required documentation, and have a satisfactory survey completed. The initial licensing fee is \$1,500 or \$30 per bed, whichever is greater.

Renewal applications must be submitted every two years, 90 days in advance of expiration of a license. The renewal fee is \$1,500 or \$30 per bed, whichever is greater. The life-safety inspection fee is \$40 or \$1.50 per bed, whichever is greater. For all non-accredited hospitals, the annual survey/inspection fee is \$400 or \$12 per bed, whichever is greater.

A contingency of licensing, any person needing emergency medical care or any woman in active labor shall not be denied access to appropriate emergency medical services and care. Emergency services and care means medical screening, examination and evaluation (triage) by a physician, or by other appropriate personnel under the supervision of a physician, to determine if an emergency medical condition exists.

The bill establishes legislative intent specifying that the rapid identification, diagnosis, and treatment of ischemic stroke can save the lives of stroke victims and in many cases can reverse paralysis, leaving victims with few or no neurological deficit and that a strong system for stroke survival is needed in the state's communities in order to treat stroke victims in a timely manner and to improve the overall treatment of stroke victims. By virtue of the law, the state intends to construct an emergency treatment system in this state so that stroke victims may be quickly identified and transported to and treated in appropriate stroke treatment facilities.

The bill also does the following:

- Requires the Agency for Health Care Administration to make available on its Internet website and to the Department of Health a list of the names and locations of hospitals that meet the criteria for a primary stroke center and the names and locations of hospitals that meet the criteria for a comprehensive stroke center. The list of primary and comprehensive stroke centers will include only those hospitals that attest by affidavit submitted to the agency that they meet the named criteria or those hospitals that attest that they are certified as primary or comprehensive stroke centers by the Joint Commission on Accreditation of Healthcare Organizations.
- Requires that if a hospital no longer plans to meet the criteria for a primary or comprehensive stroke center, the hospital must notify the agency and the agency will immediately remove the hospital from the list. This provision does not apply to a hospital that experiences a short-term unavailability of stroke treatment services. The hospital must immediately notify all local emergency medical services providers of the temporary unavailability of stroke treatment services. The hospital is required to notify all local emergency medical services providers when services resume. If stroke treatment services are unavailable for more than 2 months, the agency will remove the hospital from the list of primary or comprehensive stroke centers until the hospital notifies the agency that stroke treatment services have been restored.
- Specifies that by February 15, 2005, the agency will notify all hospitals in the state that the agency is compiling a list of primary stroke centers and comprehensive stroke centers in the state.

Included in the notification will be an explanation of the criteria for a primary stroke center and a comprehensive stroke center as well as an explanation of the process for being added to the list of primary and comprehensive stroke centers.

- Requires the agency to develop criteria for a primary stroke center that are substantially similar to the primary stroke center certification standards of the Joint Commission on Accreditation of Healthcare Organizations.
- Requires the agency to develop criteria for a comprehensive stroke center. In addition, if the Joint Commission on Accreditation of Healthcare Organizations establishes criteria for comprehensive stroke centers, the agency will establish criteria for comprehensive stroke centers that are substantially similar to those criteria established by the Joint Commission on Accreditation of Healthcare Organizations.
- Specifies that nothing in these provisions shall be construed as a medical practice guideline or to restrict the authority of a hospital to provide service for which it has received a license pursuant to chapter 395, Florida Statutes. The Legislature recognizes that all patients need to be treated individually based on each patient's needs and circumstances.
- Restricts a person from advertising to the public, by way of any medium whatsoever, that a hospital is a state-listed stroke center unless the hospital has provided notice to the agency as required by this act.
- Requires that by June 1 of every year, the Department of Health shall send the list of primary stroke centers and comprehensive stroke centers to the medical director of all licensed emergency medical services providers in the state.
- Requires the department to develop a sample stroke triage or stroke alert assessment tool. The department must post this sample assessment tool on its Internet website and provide a copy to all licensed emergency medical services providers no later than June 1, 2005. All licensed emergency medical services providers must utilize a stroke triage or stroke alert assessment tool that is similar to the sample stroke triage or stroke alert assessment tool provided by the department.
- Requires the medical director of each licensed emergency medical services provider to develop and implement assessment, treatment, and transport destination protocols for stroke patients with the intent to assess, treat, and transport stroke patients to the most appropriate hospitals.
- Requires that all emergency medical services providers licensed under chapter 401, Florida Statutes, must comply with all parts of this section by July 1, 2005.

The bill provides for an effective date of July 1, 2004.

C. SECTION DIRECTORY:

Section 1. Provides legislative intent.

Section 2. Provides definitions applicable to certified stroke treatment centers.

Section 3. Directs the agency to create and make available on its Internet website and to the Department of Health a list of primary and comprehensive stroke centers; provides criteria for inclusion on such list; requires a hospital that no longer meets such criteria to notify the agency; requires the agency to remove such hospital from the list; provides an exception; requires the hospital to notify emergency personnel if services become unavailable or resume; requires the agency to remove a hospital from the list under certain conditions; requires the agency to notify all hospitals in the state of the list; requires the agency to develop criteria for primary and comprehensive stroke centers; and provides construction requirements.

Section 4. Prohibits a person from claiming that a facility is a state-listed stroke center unless the facility has provided notice to the agency;

Section 5. Requires the department to circulate a list of stroke centers to certain medical directors of emergency medical service providers; requires the department to develop a sample stroke triage or stroke alert assessment tool; requires emergency personnel to utilize a similar tool; requires the

medical director of each emergency medical services provider to develop and implement certain protocols; and requires compliance by a certain date.

Section 6. Provides for an effective date of July 1, 2004.

II. FISCAL ANALYSIS & ECONOMIC IMPACT STATEMENT

A. FISCAL IMPACT ON STATE GOVERNMENT:

1. Revenues:

None.

2. Expenditures:

None.

B. FISCAL IMPACT ON LOCAL GOVERNMENTS:

1. Revenues:

None.

2. Expenditures:

None.

C. DIRECT ECONOMIC IMPACT ON PRIVATE SECTOR:

The designation as a Certified Stroke Treatment Center should have a positive impact on a hospital's ability to market its specialized services to the community.

An increase in the quality of life for stroke victims when treated with the latest advances in medical care is anticipated.

D. FISCAL COMMENTS:

None.

III. COMMENTS

A. CONSTITUTIONAL ISSUES:

1. Applicability of Municipality/County Mandates Provision:

This bill does not require counties or municipalities to spend funds or to take an action requiring the expenditure of funds. This bill does not reduce the percentage of a state tax shared with counties or municipalities. This bill does not reduce the authority that municipalities have to raise revenues.

3. Other:

None.

B. RULE-MAKING AUTHORITY:

The bill specifies rulemaking authority for the Department of Health.

C. DRAFTING ISSUES OR OTHER COMMENTS:

None.

IV. AMENDMENTS/COMMITTEE SUBSTITUTE CHANGES

On March 18, 2004, the Committee on Health Care adopted a strike-all amendment to HB 889 and reported the bill favorably with a committee substitute. The substitute differs from the original bill in that it requires the Agency for Health Care Administration to implement the provisions within this act rather than the Department of Health.
