

FLORIDA HOUSE OF REPRESENTATIVES

FINAL BILL ANALYSIS

This bill analysis was prepared by nonpartisan committee staff and does not constitute an official statement of legislative intent.

BILL #: CS/CS/HB 1285	COMPANION BILL: CS/CS/SB 1474 (Gaetz)
TITLE: Biosolids Management	LINKED BILLS: None
SPONSOR(S): Boyles	RELATED BILLS: None
FINAL HOUSE FLOOR ACTION: 110 Y's 0 N's	GOVERNOR'S ACTION: Approved

SUMMARY

Effect of the Bill:

The bill prohibits the Department of Environmental Protection from issuing or renewing land application site permits that authorize the disposal or land application of septage as Class B biosolids if there is a permitted wastewater treatment facility within 30 miles of the site that accepts septage for higher levels of treatment and meets certain other requirements.

Fiscal or Economic Impact:

None.

ANALYSIS

EFFECT OF THE BILL:

The bill prohibits the Department of Environmental Protection from issuing or renewing a permit for a [land application](#) site that authorizes the disposal or land application of septage¹ as Class B [biosolids](#) if there is a permitted [wastewater treatment facility](#) that accepts septage for higher levels of treatment that:

- Is less than 30 miles from a proposed Class B biosolids land application site.
- Is owned or operated by the federal government, a federal agency, a state government body or agency, or a political subdivision of the state.
- Is not defunct, used for other purposes, or out of capacity. (Section [1](#))

The bill was approved by the Governor on June 25, 2026, ch. 2026-171, L.O.F., and will become effective on July 1, 2027. (Section [2](#))

RELEVANT INFORMATION

SUBJECT OVERVIEW:

[Wastewater Treatment Facilities](#)

Domestic wastewater is water from dwellings, business buildings, institutions, and sanitary wastewater or sewage treatment plants.² In Florida, a person generates approximately 100 gallons of domestic wastewater per day.³ Properly treating and disposing of or reusing this domestic wastewater is an important part of protecting Florida's water resources.⁴ The majority of the state's wastewater is controlled and treated by centralized treatment facilities regulated by the Department of Environmental Protection (DEP).⁵ Florida has approximately 2,000

¹ The bill defines "septage" as a mixture of sludge, fatty materials, human feces, and wastewater removed during the pumping of an onsite sewage treatment and disposal system. See [s. 381.0065\(2\)\(p\), F.S.](#)

domestic wastewater treatment facilities.⁶ Current law generally requires wastewater treatment facilities to provide secondary treatment prior to reuse or disposal.⁷

Biosolids

Biosolids are the solid, semisolid, or liquid residue generated during the treatment of domestic wastewater in a domestic wastewater treatment facility and include products and treated material from biosolids treatment facilities and septage management facilities regulated by DEP.⁸ When treating domestic wastewater, biosolids accumulate in the wastewater treatment plant and must be removed periodically to keep the plant operating properly.⁹ Biosolids are high in organic content and contain moderate amounts of nutrients needed by plants, making biosolids valuable as a fertilizer and soil conditioner.¹⁰

According to DEP's estimates in 2019, wastewater treatment facilities produce about 340,000 dry tons of biosolids each year.¹¹ Biosolids can be disposed of in several ways, such as being placed in a landfill; distributed and marketed as fertilizer; incinerated; and land applied to pasture, agricultural lands, or nonagricultural lands, including park, gardens, home lawns, and golf courses.¹²

Regulation of Biosolids

Biosolids disposal and use is subject to regulatory requirements established by DEP to protect public health and the environment.¹³ Rule 62-640.650, F.A.C., provides minimum requirements, including monitoring and reporting requirements, for the treatment, management, use, and disposal of biosolids. These rules apply to wastewater treatment facilities, applicators, and distributors and include permit requirements for both treatment facilities and biosolids application sites.¹⁴

Biosolids treatment must reduce pathogens and the attractiveness of the biosolids for pests like insects and rodents.¹⁵ DEP regulates three classes of biosolids for beneficial use: Class AA, Class A, and Class B biosolids.¹⁶ Biosolids are categorized based on treatment and quality, with Class AA biosolids receiving the highest level of treatment and Class B receiving the lowest.¹⁷ Class B biosolids are treated, but still contain detectable levels of pathogens, and therefore have more restrictions on their use.¹⁸

Land Application of Biosolids

Land application of biosolids involves spreading biosolids on the soil surface or incorporating or injecting biosolids into or onto soil to condition or fertilize crops and vegetation.¹⁹ This practice provides nutrients and organic

matter to the soil on agricultural land, golf courses, forests, parks, mine reclamation sites, and other disturbed lands.²⁰ In Florida, about one-third of the biosolids produced are used for agricultural land application.²¹

In Florida, DEP regulates land application of biosolids and requires a permit for this practice.²² Applications for a biosolids land application site permit must include a site-specific nutrient management plan (NMP) that establishes the specific rates of application and procedures.²³ Biosolids may only be applied to permitted sites that have a valid NMP.²⁴ Land application of biosolids at these sites must be at the rates established in the NMP,²⁵ and application may only occur if all concentrations of minerals do not exceed ceiling and cumulative concentrations determined by rule.²⁶

Once a facility or site receives a land application permit, it is subject to monitoring, record-keeping, reporting, and notification requirements.²⁷ The requirements are site-specific and can be increased or reduced by the DEP based on the quality or quantity of wastewater or biosolids treated; historical variations in biosolids characteristics; industrial wastewater or sludge contributions to the facility; the use, land application, or disposal of the biosolids; the water quality of surface and ground water and the hydrogeology of the area; wastewater or biosolids treatment processes; and the compliance history of the facility or application site.²⁸
